

Team Working Agreement

Logistics

- Work room: BE-302
- Meeting times: Standup meeting: MF @ 5:45pm, TA meeting: Th @ 9:50am
- Project Repository
 - Location: Github
 - Organization: Service Center Organization
 - FeatureName/ #name of feature implemented by team member
 - Views/ # SwiftUI Views
 - ViewModels/# Business logic and state management
 - Models/ # Data models
 - Services/# Feature-specific services
- Communication Channels: Discord

Development Environment

- Platform: IOS
- IDE: Xcode
- Other tools: SwiftLint

Coding Style/Standards

SwiftLint standard

Work (Process) Patterns

- Definition of done
 - Tested thoroughly
 - Feature works when integrated into main app structure
 - Feature can't exist in a vacuum, must create accompanying views/safeguards
 - Feature is user friendly
 - Properly documented: code is commented extensively, plus documentation according to the templates in our official documentation
 - Reviewed by at least one other team member for correctness
- Team collaboration
 - After standup the team can ask questions about the code they are working on and the person most qualified to help will stay on the chat and help solve the issue.
- Areas of responsibility

- If a member creates a feature (eg. profile images), then that member is responsible for integrating that with the rest of the app
- Work hand-off/integration
 - Create a separate branch per task, and send a pull request on completion
 - Document work done so far when when handing off work

Product Design Patterns

- UX/UI look and feel: According to figma - modern, slick, simple, basic color scheme, easily replicable with swiftUI elements
- Product architecture: Frontend Swift, Backend Firebase
- Common approach to common problems:

Merge errors:

- Keep features in their own branches
- Communicate with team before modifying a shared file
- Frequently commit changes/pull from main branch

State management errors:

- Keeping track of global variables using state management techniques such as @EnvironmentObject

Asynchronous update issues(firestore)

- Error handling: Debug with Swift, ensure correctness with test cases
